Sequence 17710, Application US/09252991A

Sequence 17710, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERRNCE: 107196.136

CURRENT RAPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 17710
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GENERAL INFORMATION:

| Sequence 17292, Application US/09248796A
| Patent No. 6747137
| Patent No. 6747137
| GENERAL INFORMATION:
| APPLICANT: Keith Weinstock et al
| TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS
| TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
| TITLE OF INVENTION NUMBER: US/09/248,796A
| CURRENT APPLICATION NUMBER: US 60/074,725
| PRIOR FILING DATE: 1998-02-12
| PRIOR FILING DATE: 1998-02-13
| PRIOR FILING DATE: 1998-08-13
| NUMBER OF SEQ ID NOS: 28208
| SEQ ID NO 17292
| LENGTH 333
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to novel therapeutic compounds, that are designed to enhance binding to MHC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and immunomodulatory. The compounds are useful against human ovarian cancer, compounds that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for calls characterised by expression of antigen ETP3 (melanoma antigen cutaryotic initiation factor). The peptides or polypeptides conjugated to a detectable agent may be used in disponsitio procedures, such as in the catection and purification of antibodies, and as immunogens for production of antibodies. The polymuclectides can be used as primers for detecting genes or gene transcripts expressed in APC to confirm transduction of the polymucleotides into host cells. The current sequence conversed to the softence of the second of human cancer antigen eIF3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryotic translation initiation factor 3; eIF3; neoplasia; cancer; cytostatic; gene therapy; human; antigen.

Claim 7; Page; 68pp; English.

The invention relates to aiding in the diagnosis of a neoplastic condition or susceptibility to a neoplastic condition of an animal cell or tissue. The method involves determining the amount of expression of an eukaryotic translation initiation factor 3 (eIP3) protein in a test sample isolated from the cell or tissue, and diagnosing a neoplastic

Aiding in the diagnosis of a neoplastic condition, useful for treating cancer and related malignancies comprises determining the amount of expression of an eIF3 protein in a test sample isolated from the cell or

The invention relates to novel therapeutic compounds, that are designed to enhance binding to MHC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and compounds compounds are useful against human ovarian cancer, for modulating immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cells characterised by expression of antigen RIP3 (melanoma antigen eukaryotic initiation factor). The peptides or polypeptides conjugated to a detectable agent may be used in diagnostic procedures, such as in the catection and purification of antibodies, and as immunogens for production of antibodies. The polynucleotides can be used as primers for detecting genes or gene transcripts expressed in APC to confirm transduction of the polynucleotides into host cells. The current sequence represents the human cancer antigen elf3 variant 2 amino acid sequence of the polynucleotides into host cells. The current sequence represents the human cancer antigen elf3 variant 2 amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides a composition (A) for enhancing nucleic acid polymerase reactions that comprises an archaeal MCM (minichromosome maintenance protein) and at least one of the archaeal polypeptides (PCNA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MCM; minichromosome maintenance protein; archaeal polypeptide; PCNA; RFC-P38; RFC-P55; RFA; CDC6; FEN-1; dUTPase; ligase; helicase dna2; PCR; helicase 7; nucleic acid amplification; polymerase chain reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition for improving nucleic acid polymerase reactions, useful e.g. in synthesis or amplification, contains at least one archaeal accessory
                                                                                                                                                                                                                                                                                                                                                                                  created from the sequence of the wild-type human cancer antigen eIF3 sequence given in ABB08360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

CC RFC-P38 or -P55, RFA, CDC6, FEN-1, dUTPbase, ligase, helicase dna2, or helicases 2-8). (A) And similar compositions containing different CC combinations of accessory preteins, are used to improve performance of synthesis, amplification, mutagenizing, labeling and detecting reactions, c.g. for gene characterization, cloning, detection of allelic variants, diagnosis and screening for disease, particularly where done by polymerase chain reaction (FCR). Some of the proteins also stabilize duplexes during polymerase reactions or improve exonuclease reactions, cc duplexes during polymerase polymerase-mediated repair processes and for example RFA also improves specificity of nucleic acid/protein cc interaction and PCNA improves polymerase-mediated repair processes and hybridization reactions. Nucleic acids encoding the archaeal polypeptides are used for recombinant production of proteins, and fragments of the nucleic acid as probes and primers for screening related sequences. The accessory proteins increase accuracy and efficiency of polymerase. C accessory proteins increase accuracy and efficiency of polymerase. The reactions, allow use of lower denaturation and extension temperatures (possibly isothermal processing), and improve synthesis of long targets.

The present sequence represents a P. furiosus recombinant helicase 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an isolated polynucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. Alloiococcus otitidis is a Gram-positive bacterium. Also described: (I) an isolated polypeptide that is encoded by the polynucleotide (I); (2) an expression vector comprising the novel isolated polynucleotide (I), its complement, degenerate variant or fragment; (3) a genetically engineered host cell, transfected, transformed or infected with the vector of (2);
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alloiococcus otitidis, antigenic protein; immunogenic; immunisation; gene therapy; Gram-positive bacterium; infection.

composition comprising the polypeptide of (1); (5) an immunogenic composition comprising the polypeptide, its complement, biological equivalent or fragment, or the polymucleotide that is comprised in the equivalent or fragment, or the polymucleotide that is comprising the polypeptide of (1) and a carrier; (7) a protein chip comprising the polypeptide of (1) their biological equivalent or fragment; (8) immunogenic composition; (9) detecting and/or identifying Alloiococcus cuttidis in the biological sample; (10) a kit comprising a container containing the novel polymucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the genetically engineered host cell under conditions suitable to produce the polymucleotides, and (11) producing a polypeptide by culturing the polymucleotides, and (11) producing a polypeptide by culturing the polymucleotides, and (12) can be used in gene therapy. The polymucleotides polypeptides, and diagnosing diseases, drug cinvention can be used for treating and diagnosing diseases, drug creating assays and monitoring of effects during drug clinical trials. The polymucleotides are useful for expressing and detecting Alloiococcus otitidis antigen protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                          ô

The present invention describes an isolated polynucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. Alloiococcus otitidis is a Gram-positive bacterium. Also described: (I) an isolated polypeptide that is encoded by the polynucleotide (I); (2) an expression vector comprising the novel isolated polynucleotide (I); (2) and expression vector comprising the novel isolated polynucleotide (I), its

New Alloiococcus otitidis polynuclectides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.

complement, degenerate variant or fragment; (3) a genetically engineered host cell, transfected, transformed or infected with the vector of (2); (4) an antibody specific for the polypeptide of (1); (5) an immunogenic composition comprising the polypeptide, its complement, biological equivalent or fragment, or the polymucleotide that is comprised in the expression vector; (6) a pharmaceutical composition comprising the polypeptide of (1) and a carrier; (7) a protein chip comprising an array of the polypeptides of (1), their biological equivalent or fragment; (8) immunogenic composition; (9) detecting and/or identifying Alloiococcus immunogenic composition; (9) detecting and/or identifying Alloiococcus otitidis in the biological sample; (10) a kit comprising a container or the antibody of (4); and (11) producing a polypeptide by culturing the continuing the novel polymucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the polymucleotides; polypeptides antibodies and compositions of the present invention can be used for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials. The polymucleotides are useful for expressing and detecting Alloiococcus otitidis. The present sequence represents an Alloiococcus otitidis antipen protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Barley; single nucleotide polymorphism; SNP; genotype-phenotype analysis.
                         insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/spublished_pct_sequences

The invention relates to a novel method for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The method comprises modifying the alleles of a gene in diploid fungal cells by recombination using a gene disruption cassette and a promoter replacement fragment. The invention further comprises modified alleles of a different gene; a strain of diploid fungal cells comprises modified alleles of a gene, where the first allele of the gene is nactivated by a gene disruption cassette comprising a nucleotide sequence encoding an expressible selectable marker; and the expression of the second allele of the gene is regulated by a heterologous promoter the second allele of the gene is regulated by a heterologous promoter that is operably linked to the coding region of the second allele of the gene encodes the polypeptide mentioned above; a collection of diploid fungal strains comprising the diploid strains cited above, where substantially all the different genes that encode the above above, where substantially all the different genes that encode the above amino acid sequences are modified and are present in different diploid strains in the collection; a nucleic acid molecule microarray comprising nucleic acid molecules, where each nucleic acid molecule comprises a nucleocide sequence that is posting a larget in target in the comprises a nucleocide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Constructing a strain of diploid fungal cells in which both alleles of a gene are modified comprises modifying the alleles of a gene in the fungal cells by recombination using a gene disruption cassette and a promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprising any of the 310 nucleotide sequences listed in the specificaction (App881c4App8825); identifying a gene that is essential to the survival or growth of a fungus, that contributes to the virulence and/or pathogenicity of a fungus, or that contributes to the resistance of a diploid fungus to an antifungal agent; identifying an antifungal agent that that inhibits the growth of a diploid fungus, or a therapeutic agent for treatment of a mammalian disease; correlating changes in the

consists of proteins or gene transcripts with the inhibition of growth or proliferation of a diploid fingal cell, a purified or isolated molecule comprising a nucleotide sequence encoding a gene product cald molecule comprising a nucleotide sequence encoding a gene product consists of any of the above-mentioned anino acid sequences; a vector comprising any of the above-mentioned anino acid sequences; a vector comprising any of the bower of a purified or isolated closed of a polypeptide comprising any of the isolated to the nuclet caid molecule cited above; a host cell containing the vector; a purified or isolated closed to a second polypeptide, the fragment of a first polypeptide fued to a second polypeptide, the fragment of a product gene product encoded by a nucleic acid comprising any of nucleic acid comprising any of polypeptide; identifying a compound which modulates the acid nucleic acid and above; where a first alleie of a gene comprising any of nucleic acid comprising any of nucleic acid comprising any of a polypeptide, where a first alleie of a gene comprising or a heterologous promotre; identifying a compound or binding partner that binds to the polypeptide comprising any of App98126.

App9816.App9815 is intactive and a second alleie of the gene is under the control of a heterologous promotre; identifying a compound a partner that binds to the polypeptide comprising any of App98126.

App9816.App9815 or itse fragment; identifying a compound having net ablicans, compound; a control of a minfection of a subject by Candida albicans; a pharmaceutical comprising any of App9815.

Compound; arceating an infection of a subject by Candida albicans; a pharmaceutical comprising or computed or any of App9816. Security or level or product amount of an agent which reduces the activity or level or product encoded by any of App9816. Security or level or product encoded by any of App9816. Security or level or product encoded by any of App9816. Security or level or the mile active and any of App9816. Security or level o provided on the WIPO website,

Human ORFX protein sequence SEQ ID NO:13636.

Human, open reading frame, ORFX, gene therapy, cancer, cirrhosis, hyperproliferative disorder, psoriasis, benign tumour; haemorrhage, degenerative disorder, osteoarthritis, neurodegenerative disorder;

Treffered to as open reading frame, ORFX, where X is 1-11441 (see Table 1 in the specification). ABN15762 to ABN27525 encode the human ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating or syndrome associated with ORFX-associated disorder. ORFX polynucleotide syndrome associated with ORFX-associated disorder. ORFX polynucleotide syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders related to organ cransplantation, cardovascular diseases, disorders related to organ curansplantation, cardovascular diseases, disorders related to organ storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune thyroiditis, myasthenia gravis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, praft-versus-host disease and autoimmune thyroiditis, myasthenia gravis, or graft or treating observation disorders, incleases, or disease, and for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, coperticine disease and antiputy in various tissues and conditions resulting from systemic cycokine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/bublished_pot_escape. ö erythematosus; The present invention describes substantially purified human proteins **Gaps** Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders. hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis; .. 0 systemic lupus 5; Length 72; 1; Indels Disclosure; SEQ ID NO 13636; 1037pp; English. cardiovascular disease; diabetes mellitus; 72.7%; Score 32; DB 66.7%; Pred. WO200277183-A2.

Protein encoded by Prokaryotic essential gene #7370.

```
The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The protein are identified by selecting a bair protein from a known adipocyte marker and then performing a yeast 2-hybrid selection to isolate prey proteins encoded by members of an adipocyte cDNA library. The proteins are designated SID (RTM) (selected interacting danalins) proteins. Also included are a polymented encoding a polypeptide in the adipocyte cells, a cocymbiant host cell expressing at least one of the interacting colypeptides of the complex, selecting a modulating compound in adipocyte cells, a SID (RTM) polypeptide comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), a vector comprising the SID (RTM) polymuleocide, a recombinant host cell comprising the SID (RTM) polymuleocide, a recombinant host cell comprising the SID (RTM) polymuleocide, a recombinant host cell comprising the vector, a protein chip comprising the polypetides and a recombiant host cell comprising all or part of the data; listed in the specification. The complex, polypeptides, polymuleocides and compounds are useful for man and a preventing or treating metabolic disorders such as obesity or diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The polynucleotides are useful as probes or primers. The complex is particularly useful for identifying selected interacting domains (SID (RTM)) for screening drugs that modulate the protein interaction, thus exhibiting the therapeutic effect. The present sequence represents a SID (prey) protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New complex between two interacting proteins in adipocyte cells, useful for identifying selected interacting domains that modulate protein interactions, or for preventing or treating metabolic disorders such as obesity or diabetes.
                                                                                              Human, prey, adipocyte, SID; selected interacting domain, anorectic, antidiabetic, protein-protein interaction, diabetes, yeast 2-hybrid assay, metabolic disorder, obesity.

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide; (5) producing the polypeptide; (5) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a bloodgical pathway required for proliferation, or that has an activity against a bloodgical pathway required for proliferation, or that inhibits cellular proliferation of an identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product is solved to a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism. The antisense nucleic acids required for which each of the strains is present in a culture or collection of strains or a gene of its strains in the compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, required for proliferation in cells other than S. aureus, S. typhimurium, credited for proliferation in cells other sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this general directly from WIPO at the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Novel cyclooxygenase type 1 variant polypeptide and a polynucleotide encoding the polypeptide, useful for identifying a compound that binds to and modulates the activity of COX-1 variant polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an isolated cyclooxygenase type 1 (COX-1) variant polypeptide (I). (I) is useful for identifying a compound which modulates the activity of (I). A nucleotide sequence encoding (I) can be used for mapping their respective genes on a chromosome, and so locating gene regions associated with genetic disease, identifying an individual from a minute biological sample (fissue typing), and to aid in forensic identification of a biological sample. The present sequence represents PCOX-1a, which is used in the exemplification of the present invention.
                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid comprising any one of the fall antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid nucleic acid; (2) a host cell containing the vector; (3) an isolated of polypeptide or its fragment whose expression is inhibited by the antisense contined or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological compound a activity; (11) a culture of compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture compound that inhibits proliferation of an organism; (11) a culture compound that inhibits proliferation of the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of the proliferation of an organism. The antisense nucleic acids required cor actional drink disnovery expenses or for actioning the model or confident model or collection and collection of a confident and action of an organism. The arming the model acids required collection of a collection and drink disnovery expenses or a condident and acids required collection of a collection of a condident and action of an organism. The armine model acids required collection and drink disnovery expenses or a condident and actional actions are acids are useful for actional and acids required condidents for actional and acids required to a collection and acids required to a collecti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                      Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zyskind JW;

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapper control pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a correctial infection, for evaluating a compound, such as a polypeptide, of the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant or production of P. aeruginosa derived peptides for recombinant components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-CC Pseudomonas species using biochip technology. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

S69198
prostaglandin G/H synthase 1 - rat
C;Species: Rattus norvegicus (Norway rat)
C;Date: 24-Aug-1996 #sequence_revision 13-Mar-1997 #text_change 09-Jul-2004
C;Date: 24-Aug-1996 #sequence_revision 13-Mar-1997 #text_change 09-Jul-2004
C;Accession: 869198; 869198
R;Kitzler, J.W.
submitted to the EMBL Data Library, December 1994
A;Accession: 869198
A;Status: proliminary
A;Molecule type: mRNA
A;Residues: 1-602 < kITA
A;Cross-references: UNIPROT.063921; EMBL:U18060; NID:g603051; PIDN:AAA85823.1; PID:g603

c + 2 H(2)0.

C - 1 - COFACTOR: Copper A (By similarity).

- 1 - SUBCELLULAR LOCATION: Integral membrane protein. Mitochondrial inner membrane (By similarity).

- 1 - SIMILARITY: Belongs to the cytochrome c oxidase subunit 2 family. BELO AF423365, AAL56254.1; -

RR GD, GC:0016020; C:membrane; IEA.

Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Subunit 2 transfers the electrons from cytochrome c via its binuclear copper A center to the bimetallic center of the catalytic subunit 1 (By similarity).
-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                               01-DEC-2001 (TrEMBLrel. 19, Created)

Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.

-I - FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Subunit 2 transfers the electrons from cytochrome c via its binuclear copper A center to the bimetallic center of the catalytic subunit 1 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       similarity)
CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome

Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Subunit 2 transfers the electrons from cytochrome c via its binuclear copper A center to the bimetallic center of the catalytic subunit 1 (By
                                                                                                                                                                                                                                                                                                        similarity).

Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Subunit 2 transfers the electrons from cytochrome c via its binuclear copper A center to the bimetallic center of the catalytic subunit 1 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     similarity).

Submitted (SRP-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Cytochrome c oxidase is the component of the respiratory
chain that catalyzes the reduction of oxygen to water. Subunits 1-
3 form the functional core of the enzyme complex. Subunit 2
transfers the electrons from cytochrome c via its binuclear copper
A center to the bimetallic center of the catalytic subunit 1 (By

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Zaklan S.D., Cunningham C.W.; Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Subunit 2 transfers the electrons from cytochrome c via its binuclear copper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bukaryota; Metazoa; Arthropoda; Crustacea; Malacostraca;

-I. FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Subunit 2 transfers the electrons from cytochrome c via its binuclear copper A center to the bimetallic center of the catalytic subunit 1 (By
                                                                                                                                                                                                                                                                                                                                                                                                   similarity).
CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
c + 2 H(2)O.

-!- KUNCTION: Cytochrome coxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Subunit 2 transfers the electrons from cytochrome c via its binuclear copper A center to the bimetallic center of the catalytic subunit 1 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            similarity).

C + 2 H(2)O.

C - 1 COPACTOR: Copper A (By similarity).

C - 1 SUBCELUUAR LOCATION: Integral membrane protein. Mitochondrial inner membrane (By similarity).

C - 1 SIMILARITY: Balongs to the cytochrome c oxidase subunit 2 family.

1- COPACTOR: Copper A (By similarity).

1- SUBCELLULAR LOCATION: Integral membrane protein. Mitochondrial inner membrane (By similarity).

2- SIMILARITY: Belongs to the cytochrome c oxidase subunit 2 family. Belongs to the cytochrome c oxidase subunit 2 family. BEL; AF425379; AAL26537.1; -- SIMILARITY: Belongs to the cytochrome c oxidase subunit 2 family. BEQ; GO:0005103; G:membrane; IEA.

3- GO:0005139; C:membrane; Membrane; Mitochondrion; C:membrane; Membrane; Mitochondrion; C:membrane; Membrane; M
                                                                                                                                                                                                                                        -I-FUNCTION: Cytochrome coxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Subunit 2 transfers the electrons from cytochrome c via its binuclear copper A center to the bimetallic center of the catalytic subunit 1 (By similarity).

-I-CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome

Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.

-I-FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Subunit 2 transfers the electrons from cytochrome c via its binuclear copper A center to the bimetallic center of the catalytic subunit 1 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -1- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)O.

Sequence 24034, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 24034

LENGTH: 373

Sequence 117, Application US/10101464A

| Sequence 117, Application US/10101464A
| Patent No. 6768041
| GENERAL INFORMATION:
| APPLICANT: Strabala, Timothy
| APPLICANT: Higgins, Colleen M.
| TITLE OF INVENTION: and Their Use in the Modification of Plant Cells
| TITLE OF INVENTION: and Their Use in the Modification of Plant Cells
| TITLE OF INVENTION: and Their Use in the Modification of Plant Cells
| TITLE OF INVENTION WUBBER: US/10/101,464A
| TITLE OF INVENTION WUBBER: 09/104,302
| CURRENT APPLICATION WUBBER: 09/228,986
| PRIOR FILING DATE: 1999-01-12
| PRIOR FILING DATE: 1999-01-12
| PRIOR FILING DATE: 1999-01-12
| PRIOR FILING DATE: 1999-01-12
| PRIOR FILING DATE: 1999-01-12
| PRIOR FILING DATE: 2000-01-11
| NUMBER OF SEQ ID NOS: 989
| SOFTWARE: FBELSEQ for Windows Version 4.0
| SEQ ID NO 117
| LEWING HIS SES
  APPLICANT: Nieuwenhuizen, Niels
TITLE OF INVENTION: Compositions Isolated from Plant Cells
TITLE OF INVENTION: Compositions Isolated from Plant Cell Signalling
FILE REFERENCE: 11000/1020

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-09-198-452A-1050

Sequence 1050, Application US/09198452A

Patent No. 655294

GENERAL INFORMATION:
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragments
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, preve
TITLE OF INVENTION: and treatment of infection
TITLE OF INVENTION: and treatment of infection
TITLE OF INVENTION: 19003-99

CURRENT APPLICATION NUMBER: US/09/198,452A

CURRENT FILING DATE: 1998-11-24

NUMBER OF SEQ ID NOS: 6849

SEQ ID NO 1050

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description

The invention relates to novel therapeutic compounds, that are designed to enhance binding to MHC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and immunomodulatory. The compounds are useful against human ovarian cancer, for modulating immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cells characterised by expression of antigen ETP3 (melanoms antigen characterised by expression of antigen ETP3 (melanoms antigen a detectable agent may be used in diagnostic procedures, such as in the production of antibodies. The poptides can be used as in the production of antibodies. The polynocleotides can be used as primers for detecting genes or gene transcribts expressed in APC to confirm transduction of the polynocleotides into host cells. The current sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Alding in the diagnosis of a neoplastic condition, useful for treating cancer and related malignancies comprises determining the amount of expression of an eIF3 protein in a test sample isolated from the cell or

                                                                            The invention relates to novel therapeutic compounds, that are designed to enhance binding to MHC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and cancer, compounds that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of anti-bodies that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of anti-correcter vaccines and to expand immune effector cells that are specific for cells characterised by expression of antigen BIP3 (melanoma antigen cells characterised by expression of antigen BIP3 (melanoma antigen of eviction and purification of antibodies, and as immunogens for detection and purification of antibodies, and as immunogens for production of antibodies. The polymucleotides can be used as primers for detecting genes or gene transcripts expressed in APC to confirm cranscripts expressed in APC to confirm cranscripts expressed in APC to confirm cranscripts expressed from the sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to virulence genes of Yersinia species and proteins encoded by such genes. Sequences of the invention are useful in the manufacture of a medicament for treating or preventing a condition associated with infection by Yersinia e.g. tuberculosis particularly in veterinary treatment. They are useful in screening assays for identifying antimicrobial drugs. They are also used to prepare vaccines. The present sequence is Yersinia pestis 2GS mutant protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New virulence peptides encoded by a gene of Yersinia pseudotuberculosis, useful for treating or preventing a condition associated with infection by Yersinia, e.g. tuberculosis, particularly in veterinary treatment.
vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebstella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present sequence of is that of the Bacillus thuringiensis (Bt) toxin receptor of the Buropean corn borer (BCB), Ostrinia mubialis. The sequence was deduced from cDNA isolated from an ECB larva midgut cDNA. The receptor protein binds CrylA toxins, particularly CrylA(b) toxins. The invention provides compositions and methods for modulating the susceptibility of acell to Bt toxins. The compositions include Bt toxins. Creeptor proteins from the lepidopteran insects ECB, corn earworm (Heliothis zea) and fall armyworm (Spodoptera frugiperda). Nucleic acids encoding the polypeptides specific to the polypeptides, and nucleic acids nucleic acid constructs for expressing the polypeptides in cells are also provided. The methods of the invention are useful for investigating the provided. The methods of the invention are useful for investigating to structure-function relationships of Bt toxin receptors, investigating toxin-receptor interactions, elucidating the mode of action of Bt toxins, screening and identifying novel Bt toxin receptor ligands including novel insecticidal toxins, and designing and developing novel Bt toxin receptor ingands. The methods are useful for managing Bt toxin resistance in plant pests, and protecting plants against damage by plant pests. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                          European corn borer, ECB, Bacillus thuringiensis, Bt toxin, receptor, crystal protein, CrylA, biological control, insecticide, crop protection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid encoding Bt toxin receptor, useful for screening and identifying new Bt toxin receptor ligands useful as new insecticidal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      78.0%; Score 39; DB 4; Length 1717; 85.7%; Pred. The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detection, the genome of F. luminescens and related species; to study polymorphisms, for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymorphides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. Compinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes proteins, vectors containing the genes are useful.

The appeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-ended toxins or antibiotics) and as biopericides, other uses of the genes and the proteins are as virulence factors and for identifying tragets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                              Antibacterial, fungicide, insecticide, polymorphism, genetic analysis, detection, food, gene expression, plant, animal, microorganism, toxin, antibiotic, biopesticide, virulence factor, disease model, plague;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Danchin A;

```
The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA01041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin EG antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin EG B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and sequence and proteins for the treatment or prevention of infections by L. monocytogenes and related organisms. Note: The sequence data for this patent did not form part of the printed specification, but was obtained the control of community of the printed specification, but was obtained the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Genomic sequence for Listeria monocytogenes, useful e.g. for treatment and prevention of Listeria and related bacterial infections, and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dehoux P;
